Not illustrated. 1896 Excerpt: .the case of flow past sharp edges, the solution yields, infinite values of the velocities. We shall suppose the vortex to present no sharp points or edges as part of its boundary, so that the functions concerned have finite differential coefficients at the boundary, and any discontinuity arises from the difference in functional form on the two sides of the boundary. The continuity of u with u over the entire surface requires, $\int du du$, $(du du, fdu du r dx dxj dyj dz dz J i (djl M a. (du du . /- / du du Q dx dx J dy dyj dz dz J$ Hence $du du, du du du du, -, x Txdx=|Xl dy=- mX- dz=nXl (U) Q- -i i dv, dw dw$, Snarly, $- =ZXl, . - =Jx, .$, where $Xd Xa X-$ are be determined. Now $2i = df d = mX -nX-$ and two similar equations from which we derive $2 (mf-nq) =-xi +1 (Jxi + mX- + nXi)$ The equation----- $H----$ $H-- = 0 dx dy dz$ then gives $li+TOXi + -X- =$ so that $Xl =-2(m(-nr,), Xt =-2(nZ-U), x=-2 (lr, -mt).(l2)$. These values are identical with (1), as we should expect; the result implying Helmholtz s interpretation of P as a potential of matter on or beyond the boundaries of the whole fluid dealt with, and having no discontinuity at the vortex surface. The special feature of the velocities within and without a vortex, that they...
